### The Matrix for assessing impact, likelihood, and effectiveness of existing controls

Each risk is scored in terms of:

- \* **likelihood** i.e. the probability of future occurrence, how likely the risk it is that the risk will occur and how frequently it has occurred in the past.
- \* **impact** i.e. the impact on the organisation and external stakeholders if the risk occurs.
- \* **effectiveness of existing controls** i.e. given the controls which are currently in place, how effective are they at mitigating the risk.

A scale of **1** to **5** is used for **Likelihood** and **Impact**, and **1** to **3** is used for the effectiveness of existing **Controls**, according to the following matrix:

Likelihood Scale of 1 - 5	Impact Scale of 1 - 5	Controls Scale of 1 - 3
1 = Rarely, if ever	1 = No significant impact	1 = Controls highly effective
2 = Possible	2 = Minor impact	2 = Controls effective, but could be improved
3 = Likely	3 = Significant but containable impact	3 = No controls / controls are ineffective

4 = Very Likely	4 = High impact	
5 = Unavoidable / already occurring	5 = Extremely detrimental impact	

The risk score is determined **by multiplying the risk impact by the risk likelihood by the effectiveness of the controls.**

The following traffic light system can be used on a risk register to highlight / prioritise risk:

Risk Level	Risk Score	Action / Response
High	25+	CEO/Board act immediately using outside expertise if necessary.
Medium	13 - 24	Standing agenda item - work on resolving within 12 months
Low	0 - 12	Monitor in 12 months
